

Costing and Menu-Planning Template

Intended user: Students and teachers planning a lab, Cottage event, pop-up, or menu project

Purpose and directions

Purpose: Calculate ingredient cost, total recipe cost, cost per serving, and food-cost percentage while documenting yield, allergens, sourcing, and review.

When to use: Use after selecting or testing a recipe and before final purchasing or pricing decisions. The spreadsheet version performs calculations from entered quantities and prices.

Calculation method

For each ingredient, divide purchase price by purchase-unit quantity to find unit cost, then multiply by quantity used. Total the ingredient costs. Cost per serving equals total recipe cost divided by yield. Food-cost percentage equals cost per serving divided by proposed selling or service price, multiplied by 100.
